

TagMaster North America Introduces ACTS Application Software

Tacoma, WA | Oct 28, 2010 - TagMaster North America, Inc. announced the latest enhancement to their long-range RFID readers for Automated Vehicle Identification (AVI). The Access Control Tracking System (ACTS) offers an innovative solution for RFID implementation projects. Unveiled at the ASIS International 2010 security tradeshow in Dallas, Texas, ACTS has garnered immediate attention from security industry professionals for its:

ACTS

- Integration with the trusted LR-series of long-range RFID readers
- Embedded access control system for system independence
- Web-enabled interface with real-time access control

Using open architecture (Linux), the system offers familiarity, flexibility and ease-of-use. Featuring a read-range of up to 10 meters, frequency hopping (FHSS), and a variety of industry-standard interfaces, the LR-series continues its dominance of the long-range RFID market.

An LR-series reader embedded with ACTS offers ground-breaking system independence. All operating functions are handled by ACTS, eliminating reliance on external control panels or access control systems. Standard access management tools along with anti-passback capability, on-the-fly access scheduling, and state-of-the-art reporting are provided via the ACTS interface.

Using a powerful, web-enabled user interface ACTS offers the unparalleled flexibility to manage your access data securely and conveniently from any location in the world via a standard web browser. *“Over the years, TagMaster North America has worked with the vehicle access industry to understand what they needed most from their Automated Vehicle Identification provider,”* noted Ali Khaksar, President of TagMaster North America. *“The knowledge we acquired as we developed ACTS is part of our commitment to listen to our customers and provide them with the very best solution available in the vehicle access industry.”*
